WHAT IS CLAIMED IS:

 A manufacturing method of a phase shift mask, comprising:

seeking relationship of optical conditions of an exposure optical system used for exposure and a mask structure with displacement of a pattern to be transferred by exposure;

finding said optical conditions and said mask structure that can limit displacement of said pattern within a required range, taking manufacturing errors of the mask into consideration;

examining the optical conditions and the mask structure, obtained, whether they ensure a required exposure tolerance and a required focal depth; and

executing fabrication of such a mask to obtain said mask structure when the result of the examination is acceptable.

- 2. The manufacturing method of a phase shift mask according to claim 1 wherein said optical conditions include, at least, numerical aperture and partial coherence factor.
- 3. The manufacturing method of a phase shift mask according to claim 1 wherein said phase shift mask is a Levenson phase shift mask.
- 4. The manufacturing method of a phase shift mask according to claim 3 wherein said Levenson phase shift mask is of a substrate excavation type, and said

25

mask structure id regulated by amount of excavation of a substrate.

- 5. The manufacturing method of a phase shift mask according to claim 1 wherein said Levenson phase shift mask is of a phase shifter-added type, and said mask structure is regulated by thickness of a phase shifter.
- 6. A method of making a resist pattern through exposure using phase shift mask, comprising:

seeking relationship of optical conditions of an exposure optical system used for exposure and a mask structure of said phase shift mask with displacement of a pattern to be transferred by exposure;

finding said optical conditions and said mask structure that can limit displacement of said pattern within a required range, taking manufacturing errors of the mask into consideration;

examining the optical conditions and the mask structure, obtained, whether they ensure a required exposure tolerance and a required focal depth; and

when the result of the examination is acceptable, fixing said exposure optical system to the optical conditions selected, then actually manufacturing said phase shift mask having the mask structure selected, and conducting exposure using said exposure optical system and said phase shift mask.

7. The method of making a resist pattern

5

according to claim 6 wherein said optical conditions include, at least, numerical aperture and partial coherence factor.

- 8. The method of making a resist pattern according to claim 6 wherein said phase shift mask is a Levenson phase shift mask.
- 9. The method of making a resist pattern according to claim 8 wherein said Levenson phase shift mask is of a substrate excavation type, and said mask structure id regulated by amount of excavation of a substrate.
- 10. The method of making a resist pattern according to claim 8 wherein said Levenson phase shift mask is of a phase shifter-added type, and said mask structure is regulated by thickness of a phase shifter.
- 11. A manufacturing method of a semiconductor device having a step of making a resist pattern through exposure using a phase shift mask;

seeking relationship of optical conditions of an exposure optical system used for exposure and a mask structure of said phase shift mask with displacement of a pattern to be transferred by exposure;

finding said optical conditions and said mask structure that can limit displacement of said pattern within a required range, taking manufacturing errors of the mask into consideration;

examining the optical conditions and the mask

5

structure, obtained, whether they ensure a required exposure tolerance and a required focal depth; and

when the result of the examination is acceptable, fixing said exposure optical system to the optical conditions selected, then actually manufacturing said phase shift mask having the mask structure selected, and conducting exposure using said exposure optical system and said phase shift mask.

- 12. The manufacturing method of a semiconductor device according to claim 11 wherein said optical conditions include, at least, numerical aperture and partial coherence factor.
- 13. The manufacturing method of a semiconductor device according to claim 11 wherein said phase shift mask is a Levenson phase shift mask.
- 14. The manufacturing method of a semiconductor device according to claim 13 wherein said Levenson phase shift mask is of a substrate excavation type, and said mask structure id regulated by amount of excavation of a substrate.
- 15. The manufacturing method of a semiconductor device according to claim 13 wherein said Levenson phase shift mask is of a phase shifter-added type, and said mask structure is regulated by thickness of a phase shifter.
